Problem Solving Cycle

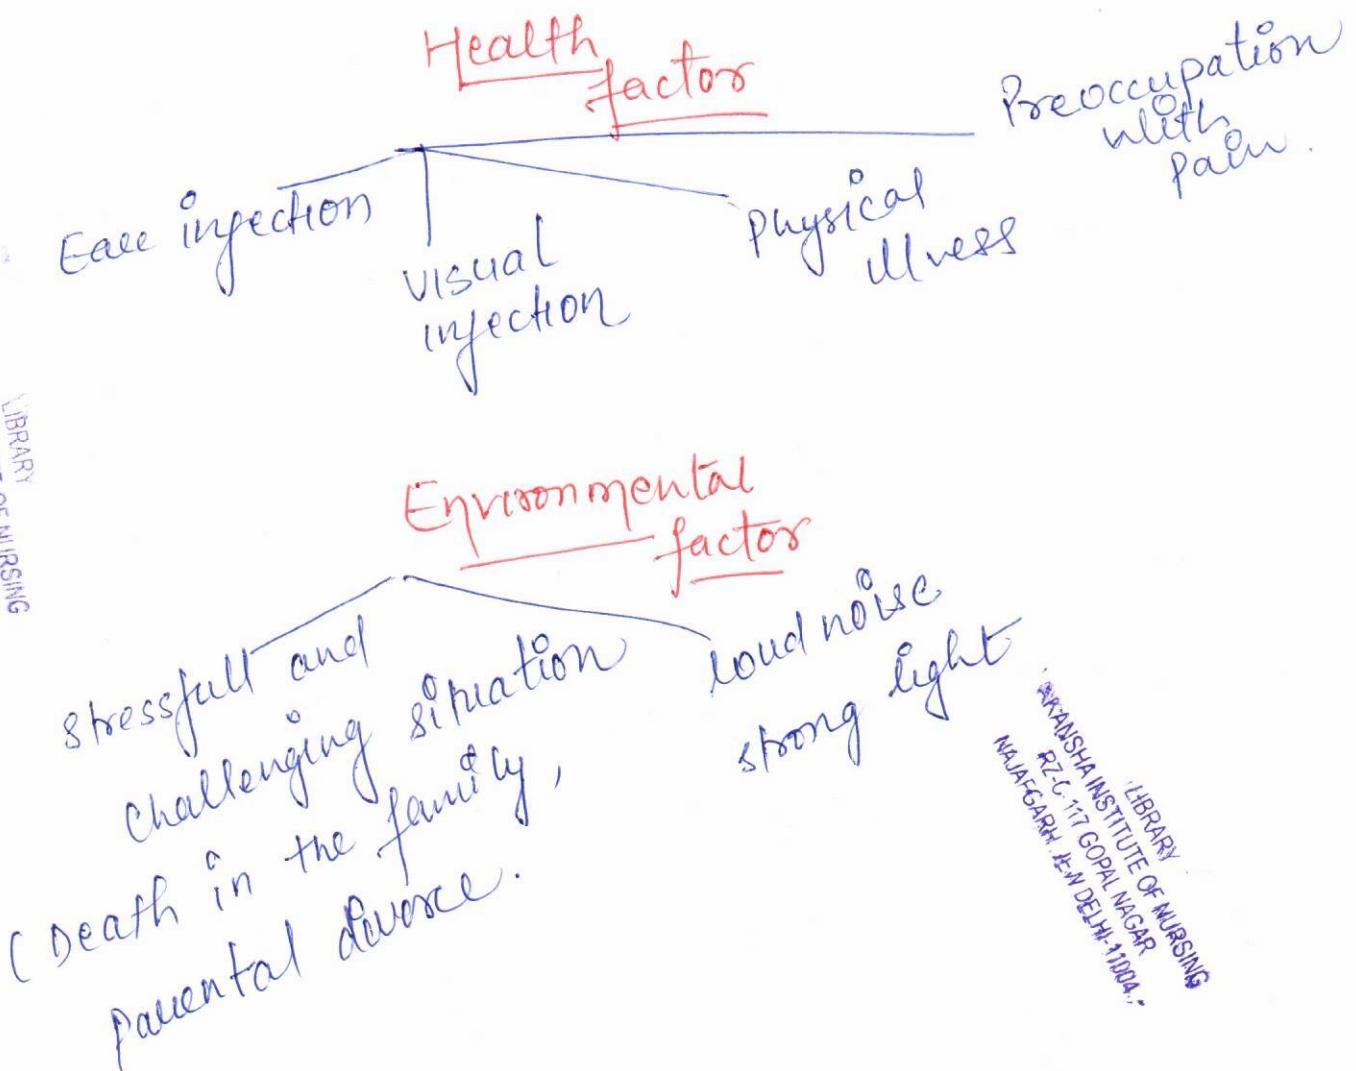

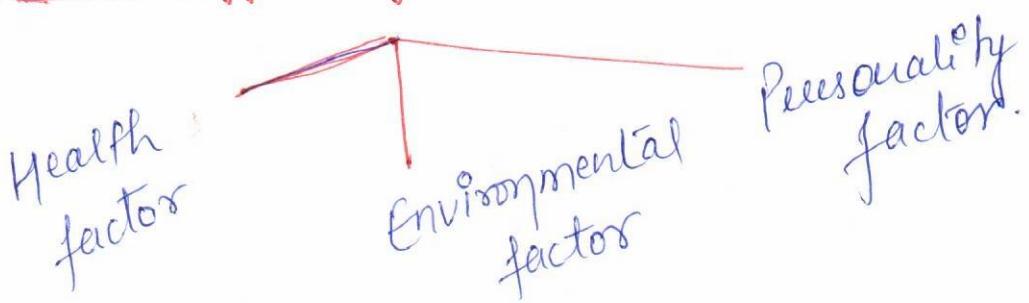

Attention

Definition: → Attention is defined as the ability to focus on a person (eg- mom, brother), object, activity for a certain period of time.

factors affecting attention :-

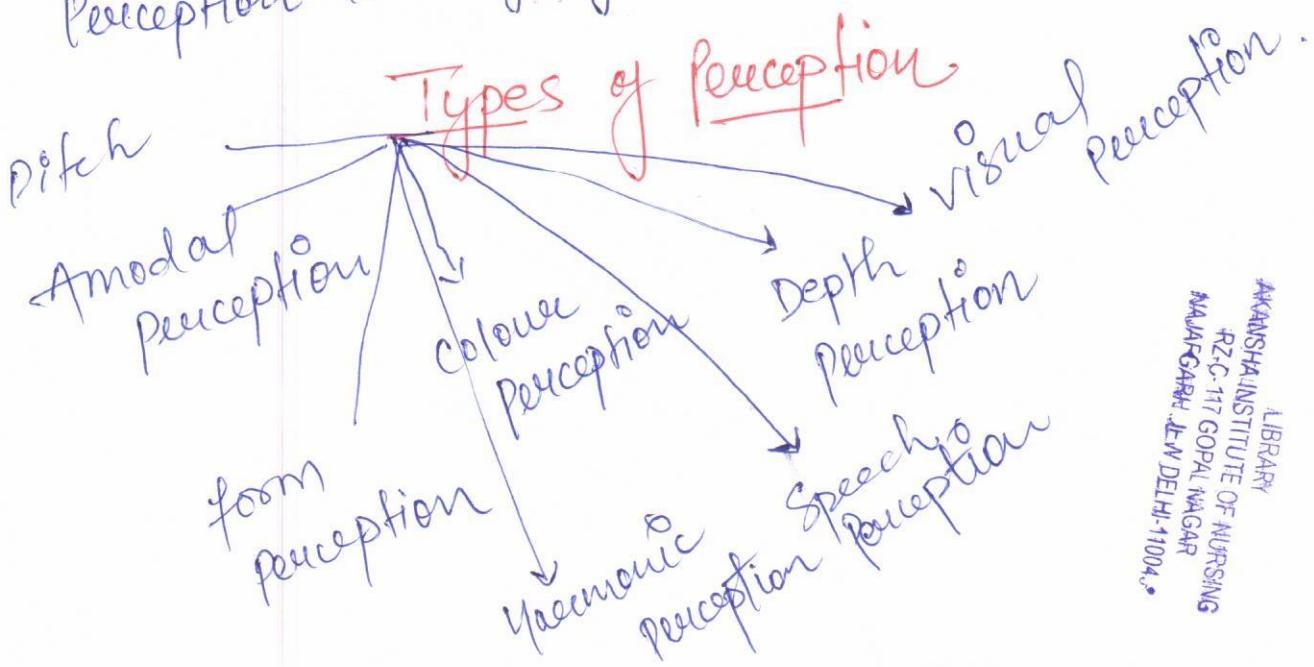

Perception

- Perception is highly individualised psychological process by which an individual analyse, identify, classify, interpret and derive meaning of stimuli sensed through his various senses.

Meaning of perception

- Perception is a process.
- Perception involve sensation.
- Perception is information extractor
- Perception is preparation to response.
- Perception provides organisation.
- Perception is highly individualized.

Principle of Perception

1. figure ground relationship

2. principle of closure.

3. principle of grouping

Principle
of similarity

Principle
of proximity

Principle
of continuity.

4. principle of contrast

Principle of good figure

5. principle of movement.

factors affecting perception

Past experience

Perceptual constancy

Need,
Value,
Opinion

Mental set and attitude

Mood and emotion

Cultural influence

Errors of Perception

Illusion

Hallucination

Illusion:- It is wrong perception in the presence of real external sensory stimuli eg - snake instead of rope.

Hallucination - It is false sensory perception not associated with real external stimuli. It may be visual, auditory, olfactory, tactile, gustatory etc. but usually visual and auditory.

illusion

- (1) The stimulus is distinct
- (2) It happens in normal condition also.
- (3) The stimulus is external
- (4) The experience is identical for everyone, in the same situation

Hallucination

- 1) The stimulus is not clear often absent
- 2) It occurs in abnormal condition.
- 3) The stimulus is in person himself.
- 4) The experiences vary among different people in same situation.
