

Human body

Sense Organ (The organ of smell)

The receptor for olfaction are in nasal epithelium along with olfactory glands which produce mucus that dissolve odorants.

Organ of Taste (Tongue)

The gustatory receptor cells are located in taste bud.

Nerve impulses are triggered in cranial nerve VII, IX, X, Taste signal are then passed to the medulla oblongata, cerebral cortex.

The Organ of Vision :-

Structure of eye include eyebrows, eyelid, eyelashes, lacrimal apparatus.

3 layers of eye

Fibrous Tunic (sclera and cornea)

Vascular Tunic (choroid, ciliary body, iris)

Organ of Hearing (Ear)

External Ear :- which collect sound wave and channel them inward

Middle Ear :- which convey sound vibration to the oval window.

Internal Ear :- consist of the bony labyrinth and membrane labyrinth. The internal ear contain the spiral organ (organ of corti), the organ of hearing.

Working of the Ear :- Sound wave enter the external auditory canal → strike the eardrum → pass through the ossicle → strike the oval window → setup wave in perilymph → strike the vestibular membrane and scala tympani → used pressure in the endolymph → vibrate the basilar membrane.

UNIT-2
